Understanding the Gains from Wage Flexibility: The Exchange Rate Connection

Jordi Galí (CREI; UPF, NBER and CEPR), Tommaso Monacelli (Università Bocconi, IGIER and CEPR),

National Bank of Serbia, 19 June 2015

[..]However, in order to increase investment activity, boost job creation and raise productivity growth, other policy areas need to contribute decisively. In particular, the determined implementation of **product and labour market reforms** as well as actions to improve the business environment for firms needs to gain momentum in several countries.

[Ecb Introductory statement 22 Jan. 2015]

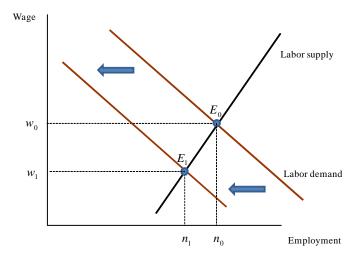

The alleged benefits of higher wage flexibility

- Wide belief in the benefits of wage flexibility
- Typical example of "structural reform"
- ► View features prominently, e.g., in the **Euro crisis** debate

## Wages and Employment: Classical View

#### Wage flexibility and employment: flexible wages

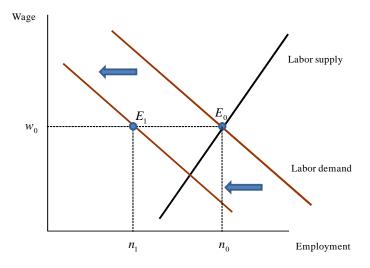

#### Wage Flexibility and Employment Stability: The Classical View

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

#### Wage flexibility and employment: rigid wages

#### Wage Flexibility and Employment Stability: The Classical View

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

## Wage flexibility and monetary policy

 Conventional (classical) wisdom ignores that - with nominal rigidities - impact of wage adjustment on employment works through monetary policy

# What happens in an economy if wages become more flexible?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Intuition: what happens in an economy if wages become more flexible?

Conditional on a given source of shocks:

- 1.  $\uparrow$  wage inflation volatility ("bad")
- 2.  $\downarrow$  employment volatility ("good")

Intuition: what happens in an economy if wages become more flexible?

- Conditional on a given source of shocks:
  - 1.  $\uparrow$  wage inflation volatility ("bad")
  - 2.  $\downarrow$  employment volatility ("good")
- ▶ What determines the breakdown between (1) and (2)?

Intuition: what happens in an economy if wages become more flexible?

- Conditional on a given source of shocks:
  - 1.  $\uparrow$  wage inflation volatility ("bad")
  - 2.  $\downarrow$  employment volatility ("good")
- What determines the breakdown between (1) and (2)? Monetary policy

#### Optimal wage setting

Each household i can reset nominal wage with probablity 1 - θ<sub>w</sub>:

$$\max \mathbb{E}_t \sum_{k=0}^{\infty} (\beta \theta_w)^k U(C_{t+k|t}(i),$$

 $N_{t+k|t}(i)$ 

t+k labor supply by type i who last reset her wage in t.

At the chosen wage W<sub>t</sub>(i), household type i assumed to supply enough labor to satisfy demand:

#### Household's wage setting problem

(Relevant portion of the) Lagrangian of household problem

$$\mathcal{L}^{w} = \mathbb{E}_{t} \sum_{k=0}^{\infty} (\beta \theta_{w})^{k} \left\{ \begin{array}{c} U\left(C_{t+k|t}, N_{t+k|t}\right) \\ -\lambda_{t+k|t} \left[P_{t+k}C_{t+k|t} - \overline{W}_{t} N_{t+k|t}\right] \end{array} \right\}$$

Leads to FOC

$$\sum_{k=0}^{\infty} (\beta \theta_w)^k \mathbb{E}_t \left\{ U_{c,t+k} N_{t+k|t} \underbrace{\left[ \frac{\overline{W}_t}{P_{t+k}} - \frac{(-U_{n,t+k|t})}{U_{c,t+k}} \mathcal{M}_w \right]}_{\text{wedge btw}}_{\text{real w. and MRS}} \right\} = 0$$

$$\underbrace{\mathcal{M}_w}_{\substack{\text{optimal ss}\\ \text{wage markup}}} \equiv \varepsilon_w / (\varepsilon_w - 1)$$

#### Optimal domestic price setting: Calvo staggering

Individual vs average nominal marginal cost:

$$MC_{t+k|t} = \left(\frac{W_{t+k}g(S_{t+k})}{(1-\alpha)A_{t+k}N_{t+k}^{-\alpha}}\right) \left(\frac{N_{t+k}}{N_{t+k|t}}\right)^{-\alpha}$$
$$= MC_{t+k} \left(\frac{P_{H,t+k}}{\overline{P}_{H,t}}\right)^{\frac{\varepsilon_{P}\alpha}{1-\alpha}}$$

 $\rightarrow$ Optimality condition

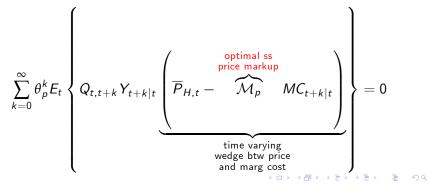

Table 1. Baseline Calibration

	Description	Value	Target
$\varphi$	Curvature of labor disutility	5	Frisch elasticity $0.2$
α	Index of decrasing returns to labor	1/4	
$\epsilon_w$	Elasticity of substitution (labor)	4.52	<i>u</i> = 0.05
$\epsilon_p$	Elasticity of substitution (goods)	9	labor income share $=2/3$
$\theta_p$	Calvo index of price rigidities	3/4	average duration $=4$
$\theta_w$	Calvo index of wage rigidities	3/4	average duration $=4$
$\phi_p$	Inflation coefficient in policy rule	1.5	Taylor (1993)
ν	Openness	0.4	import share $= 0.4$
η	Elasticity of substitution domestic vs foreign goods	1	Cole-Obstfeld
β	Discount factor	0.99	
$\rho_i$	Persistence of exogenous processes	0.9

#### Intuition

Consumption Euler

$$c_t = x_t - (1 - \nu) \underbrace{\sum_{k=0}^{\infty} E_t \{r_{t+k}\}}_{\substack{\text{LT real} \\ \text{int rate}}}$$

"Real" UIP condition

$$egin{aligned} \mathbf{s}_t &= -\mathbf{r}_t + \mathbf{E}_t\{\mathbf{s}_{t+1}\} \ \mathbf{s}_t &= -\sum_{k=0}^\infty \mathbf{E}_t\{\mathbf{r}_{t+k}\} \end{aligned}$$

►  $\phi_e > 0 \rightarrow \text{domestic price level stationary } (\lim_{T \to \infty} p_{H,T} = 0)$  $\sum_{k=0}^{\infty} E_t \{ r_{t+k} \} = p_{H,t} + \underbrace{\sum_{k=0}^{\infty} E_t \{ i_{t+k} \}}_{\substack{\text{endogenous} \\ \text{mp channel}}}$ 

## Summary so far

- 1. Effects on employment of exogenous changes in labor costs **strongly mediated** by response of monetary policy.
- 2. When the exchange rate is **fixed**, as in a currency union, supply side interventions aimed at stimulating employment through a reduction in labor costs are **less effective**
- 3. Net effect unblanced towards an increase in wage inflation instability rather than an increase in employment

## Welfare

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

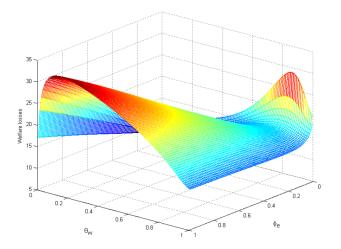

### Deriving welfare objective

#### Assumptions

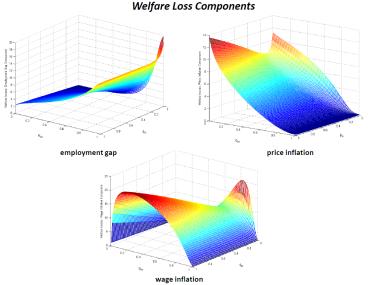

- 1. Unitary elasticity of substitution between domestic and foreign goods ( $\eta=1$ )
- 2. Optimal employment subsidy

$$\mathbb{L} \sim (1+\varphi) \operatorname{var}(\widetilde{n}_t) + \left(\frac{\epsilon_p}{\lambda_p(1-\alpha)}\right) \operatorname{var}(\pi_t^p) + \left(\frac{\epsilon_w}{\lambda_w}\right) \operatorname{var}(\pi_t^w)$$

Why non-monotonicity so different at fixed vs. flexible exchange rates?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- Why non-monotonicity so different at fixed vs. flexible exchange rates?
- ▶ Low values of  $\phi_e$ : monetary policy channel still active → Marginal (welfare) cost of higher wage flexibility quickly compensated by marginal benefit stemming from lower weight of wage inflation volatility in loss function.

- Why non-monotonicity so different at fixed vs. flexible exchange rates?
- ▶ Low values of  $\phi_e$ : monetary policy channel still active → Marginal (welfare) cost of higher wage flexibility quickly compensated by marginal benefit stemming from lower weight of wage inflation volatility in loss function.
- ▶ **High** values of  $\phi_e$ : monetary policy channel muted → Marginal increase in wage flexibility results in relatively small increase in employment and in a large increase in wage inflation volatility.

- Why non-monotonicity so different at fixed vs. flexible exchange rates?
- ▶ Low values of  $\phi_e$ : monetary policy channel still active → Marginal (welfare) cost of higher wage flexibility quickly compensated by marginal benefit stemming from lower weight of wage inflation volatility in loss function.
- ▶ **High** values of  $\phi_e$ : monetary policy channel muted → Marginal increase in wage flexibility results in relatively small increase in employment and in a large increase in wage inflation volatility.
- Under a peg, it takes a much larger increase in wage inflation to achieve any given increase in employment.

# Medium-scale DSGE Model

## Empirically realistic model

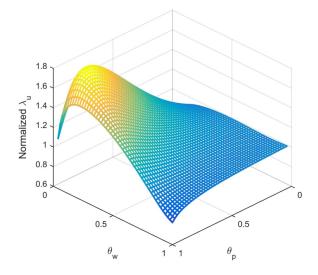

- Endogenous capital accumulation + adjustment costs
- Habit persistence in consumption
- Price and wage indexation
- Imperfect exchange rate pass-through (sticky import prices + distribution costs)
- Several shocks: demand, technology, export demand, world interest rate (volatility and persistence calibrated from data).

Calibration mostly based on NAWM '08

### Conclusions

- Benefits of higher wage flexibility depend on the monetary policy regime in place
- Supply side reforms might be welfare detrimental if not accompanied by expansions in AD
- Relevance in the EA response to persistent crisis in Europe
